DETAILED ACTION

Response to Arguments

Applicant's arguments with respect to claims 1-6 and 11-17 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-6 and 11-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kadah (PN 5,699,218) in view of Hatakoshi et al (PN 6,400,742).

Regarding claims 1-6 and 11-17,

(Claims 1-3) Kadah illustrates in figure 5 a solid-state relay system having in particular a bi-directional light emitting device (LED) (32) with a pair of LEDs oppositely electrically connected with each other, where one of the LED illuminates with forward current and the other LED illuminates with reverse current. LEDs are commonly known in the art to be composed of semiconductor material.

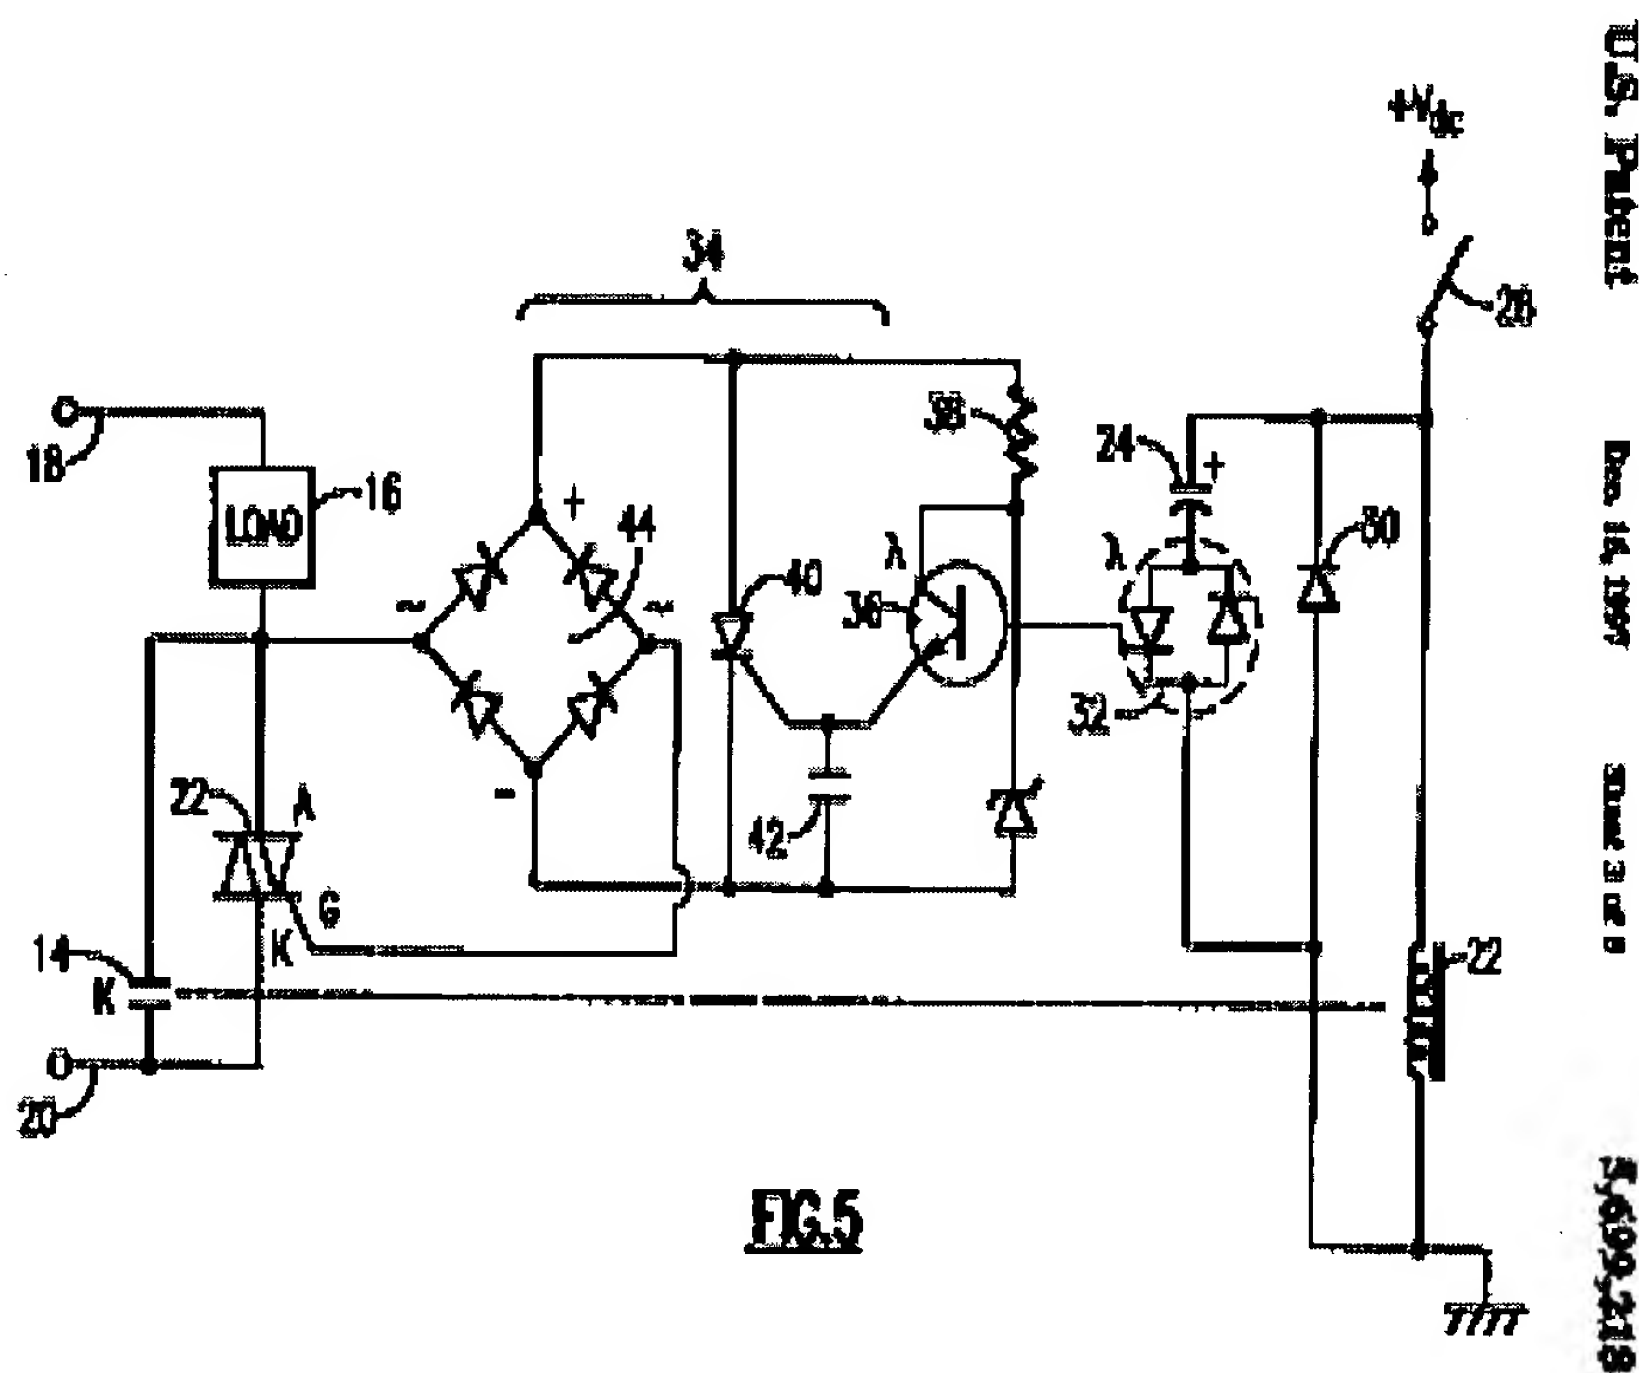

However, Kadah is silent as to the structural composition of the LEDs.

(Claims 4-6, 11-17) Hatakoshi et al illustrates in figure 17 a ridge type semiconductor laser, which may be used as a light-emitting device (LED), the semiconductor laser is composed of gallium nitride (GaN). Column 20 lines 57-61 disclosed the use of a Schottky barrier between the electrode and the laser. This

particular structure lends itself to be easily inversely electrically connected with another LED, as shown by the interconnection of Kadah.

Therefore, it would have been obvious to person having ordinary skill in the art at the time the invention was made to use the semiconductor laser of Hatakoshi et al as a light-emitting device (LED) within the solid state relay of Kadah because the semiconductor laser will electrically isolate the capacitor from the triac and provide a signal to the phototransistor.
